

CBRN Mitigation

Developing innovative solutions to protect people, property and infrastructure against chemical, biological, radiological and nuclear attacks

CBRN Threat

CBRN incidents have devastating effects on people, the environment and the economy. An event can cause large scale disruption and denial of vital services. CBRN agents can cause serious long term health problems or even instant fatality.

Fear and loss of confidence can have long term impacts on businesses and the economy. To develop appropriate mitigation measures and response plans to reduce the impact of CBRN incidents requires an integrated multidisciplinary approach.

Capita Security Consultancy's specialists and engineers provide comprehensive CBRN protection advice as part of an integrated security strategy.

Capita Security Consultancy

Risk Assessment

Identify the key assets to be protected against CBRN incidents as well as weaknesses and strengths of the existing systems and buildings operations.

Site Surveys

Undertake detailed security site surveys to review operational procedures and identify weaknesses and potential vulnerabilities against CBRN incidents.

Designing out Vulnerabilities

Undertake vulnerability assessments to identify the potential impact of CBRN incidents within various facilities and environment. Advise on organisational strategies and develop intelligent systems and standard operating procedures.

CBRN Mitigation Advise

Advise on protective physical security measures to prevent or minimise the threat and risks as well as to reduce the vulnerabilities of buildings and infrastructure against CBRN incidents.

Response Plans and Business Continuity

Develop appropriate response plans to reduce the impact of an CBRN incident on people, operations and services. Advise on strategies to allow businesses to recover operations after a CBRN incident.
